CIVIL ENGINEERING AND ENGINEERING MECHANICS

Civil Engineering and Engineering Mechanics graduates leave a deep imprint on our world. They design and build skyscrapers and long bridges, create new smart materials, manage large construction projects and urban systems, and help protect the environment in order to improve human conditions in both the developed and the developing worlds. These accomplishments are based in a curriculum that is strong on fundamentals and flexible with new ideas and trends.

Today, our objective is to mold engineers who will design, build and manage the smart cities of the future as well as restore and upgrade existing urban infrastructure.
